Programming Questions on Single-Dimensional Arrays in Java (IPL Based)

1. IPL Team Runs Analysis

Write a Java program to store runs scored by an IPL team in 10 matches using a single-dimensional array. The program should:

- Input runs scored in each match
- Display all match scores
- Find the highest and lowest score
- Calculate average runs
- Count matches where the score was above 180

2. IPL Player Batting Statistics

Write a Java program to store runs scored by an IPL batsman in different matches using a single-dimensional array. The program should:

- Accept runs scored in n matches
- Display innings one by one
- Find total runs scored
- Calculate batting average
- Count number of half-centuries and centuries
- Display the best performance

3. IPL Bowling Economy Calculator

Write a Java program to store economy rates of a bowler in different IPL matches using a single-dimensional array. The program should:

- Input economy rate for each match
- Display all economy rates
- Find best and worst economy
- Calculate average economy rate
- Count matches with economy less than 7

4. IPL Ticket Sales Management

Write a Java program to store ticket sales for 15 IPL matches in a stadium using a single-dimensional array. The program should:

- Input ticket sales for each match
- Calculate total tickets sold
- Find maximum and minimum sales
- Display matches with sales above average
- Calculate total revenue if each ticket costs ₹1500

5. IPL Team Points Table Simulation

Write a Java program to store points earned by IPL teams in a season using a single-dimensional array. The program should:

- Input points of all teams
- Display the points table
- Find the team with maximum points
- Count teams qualifying for playoffs (points ≥ 16)
- Sort points in descending order

6. IPL Match Sixes Counter

Write a Java program to store number of sixes hit in each IPL match of a tournament using a single-dimensional array. The program should:

- Input sixes count for each match
- Find total sixes hit
- Display match with maximum sixes
- Calculate average sixes per match
- Count matches with more than 20 sixes

7. IPL Wicket Statistics System

Write a Java program to store wickets taken by a bowler in IPL matches using a single-dimensional array. The program should:

- Input wickets taken in each match
- Find total wickets
- Display highest wickets in a match
- Count number of matches with 3 or more wickets
- Calculate bowling average wickets per match

8. IPL Team Net Run Rate Analyzer

Write a Java program using a single-dimensional array to store Net Run Rate (NRR) values of IPL teams. The program should:

- Input NRR values
- Display all NRRs
- Find highest and lowest NRR
- Count teams with positive NRR
- Sort NRR values in ascending order

9. IPL Match Attendance System

Write a Java program to store audience attendance for IPL matches using a single-dimensional array. The program should:

- Input attendance of each match
- Display attendance details
- Find highest attended match
- Calculate average attendance
- Count matches with attendance above 50,000

10. IPL Fantasy League Points Calculator

Write a Java program to store fantasy points earned by a player in different IPL matches using a single-dimensional array. The program should:

- Input fantasy points
- Display all points
- Find highest and lowest points
- Calculate total and average points
- Count matches where points exceeded 100

11. IPL Boundary Analysis Program

Write a Java program to store number of boundaries hit by a team in each IPL match using a single-dimensional array. The program should:

- Input boundaries for each match
- Display all boundary counts
- Find total boundaries

- Find match with highest boundaries
- Calculate average boundaries per match

12. IPL Captain Win Record System

Write a Java program to store wins achieved by an IPL captain across seasons using a single-dimensional array. The program should:

- Input wins for each season
- Display season-wise wins
- Find maximum wins
- Calculate total wins
- Determine consistency by counting seasons with more than 8 wins

13. IPL Powerplay Score Analyzer

Write a Java program to store powerplay scores of a team in IPL matches using a single-dimensional array. The program should:

- Input powerplay runs
- Find highest and lowest powerplay scores
- Calculate average powerplay score
- Count matches with powerplay score above 60
- Display all scores in reverse order

14. IPL Orange Cap Competition

Write a Java program to store runs scored by top IPL batsmen using a single-dimensional array. The program should:

- Input runs scored by players
- Display player rankings based on runs
- Find Orange Cap winner
- Calculate average runs
- Identify players scoring above average

15. IPL Match Winning Margin Analysis

Write a Java program to store winning margins of IPL matches of team batting first using a single-dimensional array. The program should:

- Input winning margins
- Display all margins
- Find closest and biggest victory
- Calculate average winning margin
- Count matches won by more than 50 runs
